Domains & SSL

Creating an SRV entry

You can create an SRV entry within our central customer management (ZKM) interface by clicking on the DNS system setup.

The SRV entry is structured as follows:

Host:
_Dienst._Protokoll.Domain
The host entry consists of the offerd service, the protocol used usually _tcp and the domain name from the offered services. _

Example: _http._tcp.example.com

TTL Time to live Default value here is 300

TYPE SRV

Prefence leave blank

Data Priority weight Port Domain
The priority weight is used for load balancing when multiple services will be operated with the same priority.
The port is the destination port on the host.
Domain is the name of the destination domain.

Example:

10 8080 proxy.example.com now everything coherent

Host	TTL	Type	Preference	Data
_http._tcp.beispiel.de	300	SRV		10 8080 proxy.beispiel.de
