vSphere

Why I cannot create an virtual machine (VM)?

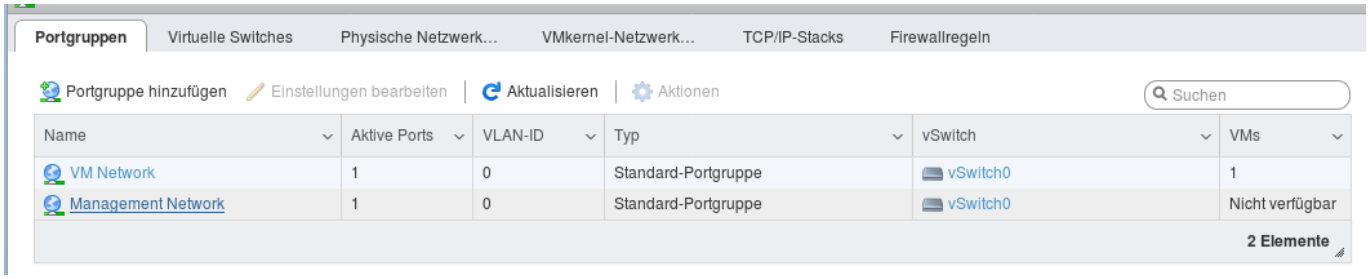

After the installation of a vSphere/ESXi environment, a port group for the creation of virtual machines must be created on the vswitch then available.
- tested with vSphere 6.5

You can keep the default settings when setting up the port group, you only have to give the port group a unique name.

After the setup, the new port group is displayed in the overview and you can then start setting up your VM.

Unique solution ID: #1506
