

vServer / Virtual Dedicated Server

How do i change the Hostname?

Sometimes it is necessary to change the hostname in the server settings. To change the hostname for a VPS (no dedicated server) we have a comfort function in the customer panel.

Table of Contents

- [1. Explanation](#)
- [2. Procedere](#)

1. Explanation

To set the hostname, which is controlled by the hostsystem in a VPS, you need to make a change in the customer panel. A simple change in windows or linux (/etc/hostname) does not work because changes are reverted after a restart.

2. Procedere

Click on "Change Hostname" in the customer panel under the vps management.

The screenshot displays the 'vServer Management :: Overview' page. At the top, there is a navigation bar with links for Home, Contracts / Billing, My Products, Domains, Support, and Account. Below this, there are tabs for Overview, Firewall, Backup, and Monitoring. The main content area is titled 'vServer Management :: Overview' and contains a sub-header 'vps[redacted].fastwebservice.de (cs[redacted])'. The page is divided into several sections: 'System Details' (Server, Hostsystem, Producttype, Operating System, Licensing Status, IP-Address, IP-Address (v6)), 'Administration' (Reset Password, Configure Firewall, Restart, Change Hostname, VNC Console, Request null route), 'Cloud Options' (Customize Performance, Cost Overview), and 'Login Details' (User, Initial password). A red arrow points to the 'Change Hostname' button in the Administration section.

vServer / Virtual Dedicated Server

After that a dialog window opens. Here the correct hostname can be set.

Change hostname for IP address [REDACTED] ×

Hostname

vps [REDACTED].fastwebserver.de

Unique solution ID: #1538
