Dedicated Server

How do I change the mount directory of my Moonshot storage ?

Table of Contents

Explanation

Moonshot Storage is based on the iSCSI protocol.

The script that integrates the Moonshot storage is located in /etc/init.d/mountstorage

1. unmount Storage

/etc/init.d/mountstorage stop

2. Create desired directory

Example: In our example, the "test" directory is created in the home directory.

mkdir /home/test

3. Change mount point in init script

To change the mount point in the script, first open the file /etc/init.d/mountstorage with an editor of your choice. In our case we use "nano".

nano /etc/init.d/mountstorage

There you replace /storage with your desired directory.

```bash
#!/bin/bash
### BEGIN INIT INFO
# Provides:          mountstorage
# Required-Start:    open-iscsi
# Required-Stop:
# Default-Start:     2 3 4 5
# Default-Stop:      0 1 6
# Short-Description:
# Description:
### END INIT INFO

case "$1" in
        start)
                mount -o defaults,discard /dev/sdb1 /storage
                if [ "no" == "yes" ]; then
                        mount --bind /storage/changes /changes
                        mount --bind /storage/files /files
                fi
                if [ "no" == "yes" ]; then
                        mount --bind /storage /home
                fi
                exit 0
        ;;
        stop)
                umount /dev/sdb1
                exit 0
        ;;
        *)
                echo "Usage $0 {start|stop}" >&2
                exit 1
        ;;
esac
```

4. start init-script

/etc/init.d/mountstorage start
